### 1

**V** is the vertex that we are looking at in that iteration.

V	A	B	C	D	E	F	G	H	I	S
X	0	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$
A	0	4	-2	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$	$\infty$
B	0	4	-2	$\infty$	$\infty$	$\infty$	2	0	$\infty$	$\infty$
C	0	4	-2	0	$\infty$	-1	2	0	$\infty$	$\infty$
D	0	4	-2	0	$\infty$	-1	2	0	$\infty$	$\infty$
E	0	4	-2	0	$\infty$	-1	2	0	$\infty$	$\infty$
F	0	4	-2	0	$\infty$	-1	2	0	$\infty$	$\infty$
G	0	4	-2	0	$\infty$	-1	2	0	1	$\infty$
H	0	4	-2	0	$\infty$	-1	2	0	1	$\infty$
I	0	4	-2	0	$\infty$	-1	2	0	1	$\infty$
S	0	4	-2	0	$\infty$	-1	2	0	1	$\infty$

After  $|V|$  iterations of checking the distance with different vertex lengths, the distances don't change.

### 2

No, this is not true, because if the amount of in-edges and the amount of out-edges are not the same, the minimum cut could be changed to another variant.

### 5

We have a minimum complexity of  $\mathcal{O}(V + E)$  because of BFS. If we have no negative weights, the loop over  $V$  will still happen  $V$  times, because in the worst case all the values will keep being updated, a negative value could ruin this, but since we don't have those, we are fine. So in a worst case scenario the loop over  $V$  and the inner loop over  $E$  will still happen. Thus it is  $\mathcal{O}(|V| * |E|)$
